

Guest Speaker #1

Shan Zhang discussed several key points about GenAI and how it is used in education. Most states offer curriculum in K12 to teach young students about how to use AI effectively, mostly because the use of AI is inevitable and teaching healthy usage of it for children at a young age will be very beneficial. Teaching students to use metacognition to gauge their own understanding on their education helps prevent GenAI usage's harmful effects. In China they even require students to do it at a young age. One notable harmful effect of LLM usage that was mentioned is information convolution. GenAIs can go on tangents when prompted that could lead to all sorts of new, unnecessary information to be presented to the student that could cloud their already partial understanding and make learning traditionally even more difficult. It's important that we all use AI effectively by being mindful of how we use it, solely as a tool rather than a scapegoat; Teaching the younger generations how to use LLMs beneficially is crucial.
